FIBERGLASS MANWAYS

FLEX-ING™ fiberglass manways provide maximum access to tank sumps while delivering solid durability. They feature a full fiberglass construction, composite lightweight lid, and unique contoured skirt design to give the manway added strength.

MAXIMUM SUMP ACCESS & WATER DRAINAGE

1 WIDER ACCESS

The expansive 43" diameter of the manway opening provides ample workspace for serving and maintaining the tank sump equipment.

2 COMPOSITE LID

A single technician can easily remove the lightweight cover while the composite construction and design allow the cover to stand up to the harshest forecourt conditions. It exceeds H20 and HS20 load standards.

3 MAX DRAINAGE

The 47" flared base of the skirt maximizes the space around the tank sump to direct water away from the sump.

4 CONTOURED SKIRT

The contoured skirt provides a larger surface area for concrete support which allows the concrete to bear more of the load from traffic above.

5 HIGH STRENGTH

The rigid, all-fiberglass construction holds it's shape against the pressures of ground movement.
